RELEASE NOTES

Applicare Release Notes for Version 10.0

Applicare 10.0 · Updated June 19, 2026 · **Pending technical review**

- **Dashboard Redesign:** Redesigned the dashboard with a modern user interface, application portfolio cards, aggregated health metrics, and a Top Problems panel. These enhancements provide improved visibility into application health, faster issue identification, and a more intuitive navigation experience.
- **Key Business Transaction (KBT) Alerts Screen:** Added a dedicated KBT Alerts screen that displays failure and duration alerts, along with an Alerts by Type chart for better monitoring and analysis.

```text
**\*\*Navigation:\*\*** Business Transactions → KBT Alerts
```

- **Per-Transaction Alert Configuration:** Introduced transaction-level alert configuration, allowing individual failure and duration thresholds to be defined for each transaction. Separate email recipient lists can also be configured per transaction.

```text
**\*\*Navigation:\*\*** Business Transactions → Settings → Edit Transaction
```

- **Report Management Enhancements:** Generated reports are now retained and can be viewed, downloaded, or emailed at any time without requiring regeneration, improving accessibility and reducing processing time.
- **Applicare Intelligence:** Introduced Applicare Intelligence, an AI-assisted diagnostics capability that analyzes available signals across the environment and identifies the most likely areas of impact during a selected time window. This helps teams focus investigations more effectively and accelerate troubleshooting.
